

IQ Retail — Stock Export Procedure

JR Importers Walvisbay · IQ SaaS POS, Version 2023.1.0.0 · 1,574 items in Stock Maintenance
· August 2026

This is a **one-time move, not a sync**. IQ stays running and stays the master until the new system is verified against it, then it is switched off. Because this is the SaaS edition, the database is hosted by IQ — the CSV export route is the only route, and it is enough.

Exporting is read-only and cannot hurt the data. Follow the steps in order; the order matters.

Step 0 — Before you start: take a backup

Take a full IQ backup, and confirm you can restore it. A migration is exactly when you want to find out that the backup works — not afterwards.

Step 1 — The stock export, field by field

In **Stock** → **Stock Maintenance**, click **Select Visible Fields** and tick exactly the fields below. Everything else can stay off — extra columns are harmless but make the mapping screen longer to read.

Tick	IQ field	Becomes	Note
☐	CODE	Stock code	The key everything matches on
☐	DESCRIPT	Description	
☐	BARCODE	Barcode	Lets the till scan it
☐	DEPARTMENT	Category	
☐	AVRGCOST	Cost price	Average cost, not last cost — it is what IQ values the shelf at
☐	SELLPINC1	Selling price	The VAT-inclusive one. See the warning below
☐	ONHAND	Quantity on hand	The opening count
☐	ORD_LVL	Reorder level	Drives the low-stock alerts
☐	SINGLE_SER	—	Not imported, but tells us which lines IQ tracks by serial
☐	ColourDesc	Colour	Only if you use it
☐	SUPPLIERCO	—	Not imported yet; useful for checking
☐	OnHandValue	—	Sanity check only: its total should equal ONHAND × AVRGCOST

The one that matters most: tick **SELLPINC1**, not **SELLPRICE1**.

SELLPRICE1 is exclusive of VAT; SELLPINC1 includes it. Prices are stored and shown inclusive throughout the new system — the shop says “VAT inclusive”, and the invoice works VAT backwards out of the total. Mapping the exclusive column would understate every price by 15% and quietly wreck every margin figure.

Then export

Click **Accept**, then **Export** at the bottom of Stock Maintenance, and choose **CSV**.

Do not open the file in Excel and re-save it.

Excel rewrites number formats and strips leading zeros off codes, and a stock code that loses its zeros stops matching anything.

Step 2 — Export the full set, in this order

Every IQ grid exports the same way: open it, then **right-click** → **Export** (or the **Export** button) and choose **CSV**. Excel format is acceptable — do not use PDF.

For these exports, take **all columns**, not just the visible ones. There is usually a “select all fields” option in the export dialog; use it. A column that looks useless in IQ is often the one that links two files together.

#	Where in IQ	What it becomes	Why it matters
1	Stock → Stock Maintenance / Stock Master	Products	Codes, descriptions, cost, selling price, VAT flag
2	Stock → Stock Take / Stock on Hand	Opening quantities	The real numbers. Everything downstream depends on this
3	Debtors → Debtors Maintenance	Customers	Names, contacts, addresses, credit limits, balances
4	Creditors → Creditors Maintenance	Suppliers	Who you buy from
5	Stock → Reports → Sales History (12–24 months)	Sales history	Gives the reports something to say on day one
6	Debtors → Reports → Age Analysis	Debtors ageing	What is owed, and how old
7	Stock → Serial Number Tracking, if used	IMEIs	Only if you have been capturing serials in IQ

Stock on hand is second on purpose: every figure downstream is measured against it, and it is the number this business has never had a trustworthy version of.

Step 3 — Name the files, and do not clean them

Keep the IQ names, or prefix them plainly: **stock-master.csv**, **stock-on-hand.csv**, **debtors.csv**, **creditors.csv**, **sales-history.csv**.

Do not clean the files up.

Not the headers, not the blank rows, not the odd formatting. The importer is written against what IQ actually produces, and a tidied file hides the shape of the real one.

Step 4 — Send them over, then import

Once the files exist they go through the admin's **Import IQ** screen: pick the target (Stock master, Serial numbers, Debtors, Creditors), upload the CSV, confirm the column mapping, and run the **dry run**. Nothing is written until the dry run has been read. Imports match on stock code, so re-running an export updates rather than duplicates.

The importer already handles the known wrinkles: department codes become real category names (001 → Smartphones, 002 → Accessories), the NS non-stock lines are excluded, negative on-hand comes in at zero

and is reported, and discontinued lines are imported but hidden from the shop.

Step 5 — Verify before switching anything off

Nothing gets trusted until these three agree with IQ, **on the same day**:

Check	What has to agree
1. Stock value at cost	The total, and the value by category
2. Unit counts	The twenty highest-value lines, counted
3. Debtors	The total owed, and the ageing buckets

Then run both systems for a week with IQ still the master, comparing daily takings. When a week passes with no disagreement, IQ comes off — and from that moment the new system is the only writer.

The last stock import happens at cutover, and never again after it.

Refreshing quantities from IQ is only safe while IQ is still the master. Once the new till starts selling for real, a re-imported ONHAND column would overwrite live stock movements.

What will not come across, and why

Stays in IQ	Why
The general ledger	The new system is a POS and stock system, not a full accounting package. The accountant keeps whatever they use; the VAT return and reports here feed it.
Historical documents	Old invoices and GRVs as printed documents stay in IQ. The transactions come across. Keep a copy of the IQ data after switching off — Namibian record retention is five years.
IQ's report layouts	The equivalents are rebuilt in the new system, not converted.
